1.1 Flowmeter solutions in an all-metal design

Solid metal DK flowmeters are suitable for measuring the flow rate of liquids, gases and vapors. Because of their robust design the flowmeters are particularly suited for difficult operating and environmental conditions.

Highlights

- DK32 with horizontal connections - with valve
- DK34 with vertical connections - without valve
- DK37 with an increased measurement accuracy and larger indication
- Narrow design enabling a high packing density
- Simple installation and start-up

Industries

- Chemical
- Heating, cooling, and air conditioning
- Iron, Steel & Metal
- Electronics
- Oil & Gas
- Petrochemistry
- Power plants
- Mechanical engineering
- Paper & Pulp
- Water

Applications

- Fine metering
- Gas chromatography
- Minimum level monitoring and control
- In conjunction with a differential pressure regulator: Ensures constant flow rate in the case of variable inlet or outlet pressures

1.2 Variable-area flowmeters of the type DK metal

DK32

- Max. two limit switches (NAMUR) or floating reed contact
- Horizontal process connections
- For flow rates of 0.15 l/h and greater (water) and 1.6 l/h (air)
- Option with valve on top or without valve

DK34

- Max. two limit switches (NAMUR) or floating reed contact
- Vertical process connections
- For flow rates of 0.15 l/h and greater (water) and 1.6 l/h (air)

DK32 with inlet pressure regulators

Inlet or outlet pressure regulators are used to provide constant flow rates in the case of variable inlet or outlet pressures.

DK37/M8E

- Electronical bargraph indication
- 4...20 mA current output and HART® communication
- For flow rates of 0.15 l/h and greater (water) and 1.6 l/h (air)
- Option with valve on top or without valve

DK37/M8M

- Max. two limit switches (NAMUR)
- Horizontal process connection
- For flow rates of 0.15 l/h and greater (water) and 1.6 l/h (air)
- Option with valve on top or without valve

DK37 with inlet pressure regulators

Inlet or outlet pressure regulators are used to provide constant flow rates in the case of variable inlet or outlet pressures.

1.3 Operating principle

The flowmeter operates on the float measuring principle.

The measuring section consists of a metal cone in which a float can move freely up and down. The medium flows through the flowmeter from bottom to top.

The float adjusts itself so that the buoyancy force A acting on it, the form drag W and its weight G are in equilibrium: G = A + W.

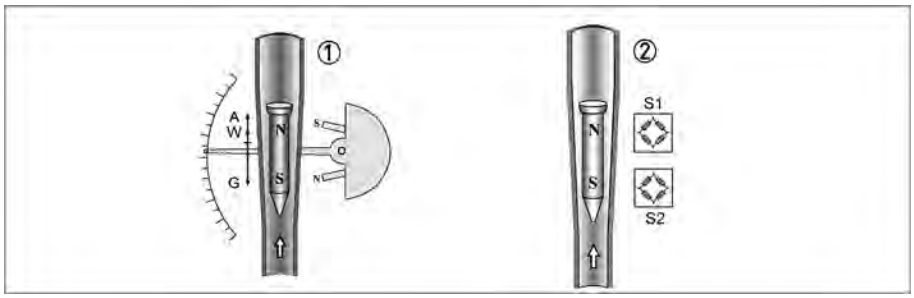

Figure 1-1: Operating principle

For the DK32, DK34 and DK37/M8M ① the flow-dependent height of the float in the measuring section is transmitted by means of a magnetic coupling and displayed on a scale.

For the DK37/M8E ② the flow-dependent height of the float in the measuring section is transmitted to the electronic display by means of a magnetic coupling on sensors S1 and S2.

2.1 Technical data

- *The following data is provided for general applications. If you require data that is more relevant to your specific application, please contact us or your local representative.*
- *Additional information (certificates, special tools, software,...) and complete product documentation can be downloaded free of charge from the website (Download Center).*

③ Spindle rotation n

2.4 Differential pressure regulators

Differential pressure regulators are used (DK32 and DK37 only) to help maintain constant flow rates in the case of fluctuating inlet or outlet pressures. Minimum pressure levels are required to permit operation of the regulators (see Regulator characteristics).

Differential pressure regulators are not pressure reducing valves!

① Inlet pressure regulators, types RE, NRE
The regulators maintain a constant flow rate at variable inlet pressure and constant outlet pressure.

Example: Inlet pressure regulator RE-1000:	Current flow rate:	1000l/h air
	Constant outlet pressure p2:	1.013 bar abs.

With a variable inlet pressure greater than 0.5 bar the flow rate in the device is constant.

② Outlet pressure regulators types RA, NRA
The regulators maintain a constant flow rate at constant inlet pressure and variable outlet pressure.
In order to function, there must be pressure difference between the inlet pressure and the outlet pressure. The inlet pressure p1 must always be greater than the outlet pressure p2.

Example: Outlet pressure regulator NRA-800	Current flow rate:	800l/h air
	Constant inlet pressure:	6 bar

With a variable outlet pressure of 0...5.5 bar the flowrate in the device remains constant.

3.1 Intended use

The variable area flowmeters manufactured by KROHNE Messtechnik GmbH are suitable for measuring gases, vapors and liquids.

These flowmeters are particularly suitable for measuring:

- Liquids
- Hydrocarbons
- Water
- Chemicals with low corrosiveness
- Saturated steam
- Superheated steam
- Industrial gases

In case of instruments which are used in explosive endangered areas please consider the supplementary installation and operating instructions mentioned in the Ex-manual.

The operator shall bear sole responsibility for the use of the flowmeters with regard to suitability, intended use and corrosion resistance of the materials used to the process product. The manufacturer shall not be liable for any damage resulting from improper use or use for other than the intended purpose.
Do not use any abrasive or highly viscous process products.

3.2 Installation requirements

When installing the flowmeter in the piping please observe the following points:

- *The variable area flowmeter must be installed vertically (measuring principle). The flow direction must be from bottom to top. For installation recommendations please refer also to VDI/VDE Directive 3513 Sheet 3.*
- *Before connecting, blow or flush out the pipes leading to the flowmeter.*
- *Pipes for gas flow need to be dried before the flowmeter is installed.*
- *Use connectors suitable for the particular version of the flowmeter.*
- *Align the pipes axially with the connections on the flowmeter so that they are free of stresses.*
- *If necessary, the piping has to be supported to prevent vibrations being transmitted to the flowmeter.*
- *Do not lay signal cables directly next to cables for the power supply.*
- *If several instruments are installed side by side, a minimum distance between these divices is required (see Technical Data).*

4.1 Electrical connection of limit switches

The electrical connections for limit switches is effected:

- DK../../S - in the plug connector
- DK../../L - using a preassembled cable.

The following procedures must be performed (DK../../S):

- Slacken screw ⑥ of the connector plug
- Pull out the plug
- Remove screw ⑥ completely from the plug
- Insert a screwdriver in the marked opening ⑤ (Lift) and remove the terminal block.
- Thread the connecting cable through the cable gland.
- Insert the cable (max. 1.5mm^2) and screw down.

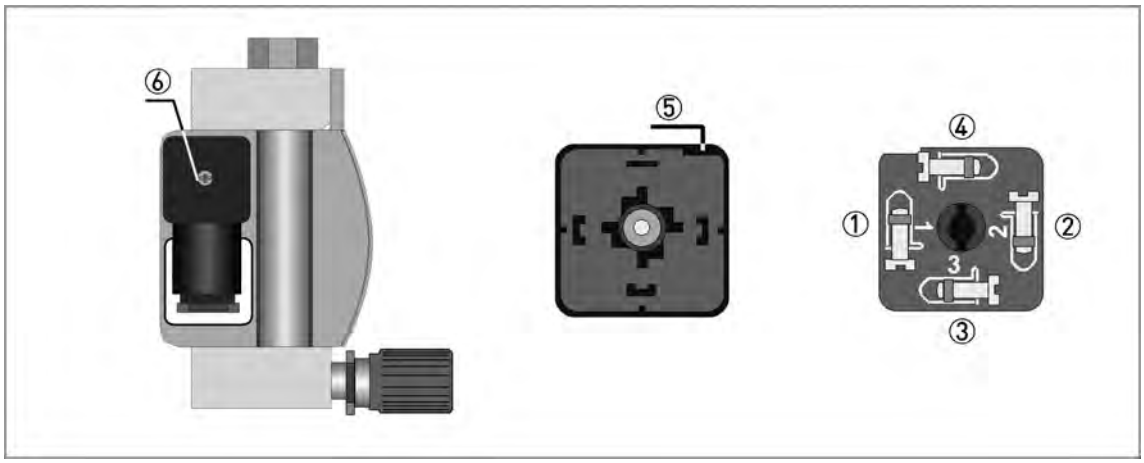

Figure 4-1: Electrical connection of limit switches

⑤ - Lift slot

② Silicone-insulated wire - brown / FEP-insulated wire - brown
③ Silicone-insulated wire - blue / FEP-insulated wire - blue

4.2 DK37/M8M limit switches

The limit switches can be set over the entire measuring range using the maximum pointer. The set limit values are displayed on the scale. The pointers are set to the desired limit values using a slip coupling along the scale.

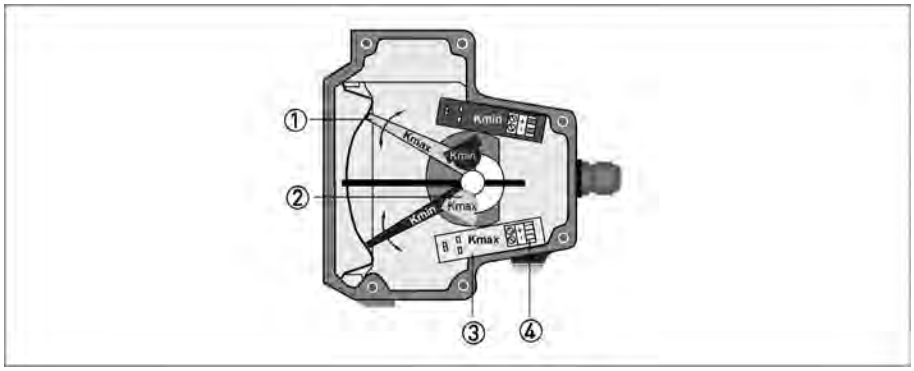

Figure 4-3: Limit switch setting

① Maximum pointer, switching point indicator
② Limit switch
③ Connection board
④ Connection terminal

4.3 DK37/M8E electrical signal output

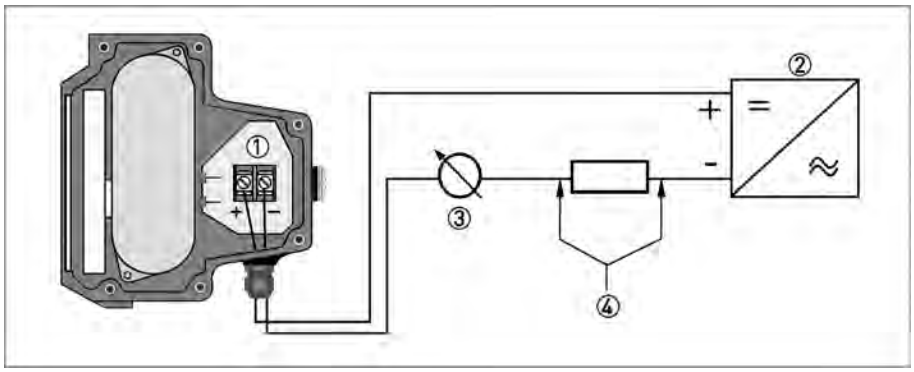

Figure 4-4: Electrical connection M8E

① Terminal connection
② Auxiliary power 14.8...30VDC
③ Measurement signal 4...20mA
④ External load, HART® communication

The circuitry for connection to other devices such as digital evaluator units or process control equipment must be designed with especial care. In some circumstances internal connections in these devices (e.g. GND with PE, ground loops) may lead to impermissible voltage potentials, which can compromise the function of the device itself or a connected device. In such cases a protected extra-low voltage (PELV) is recommended.

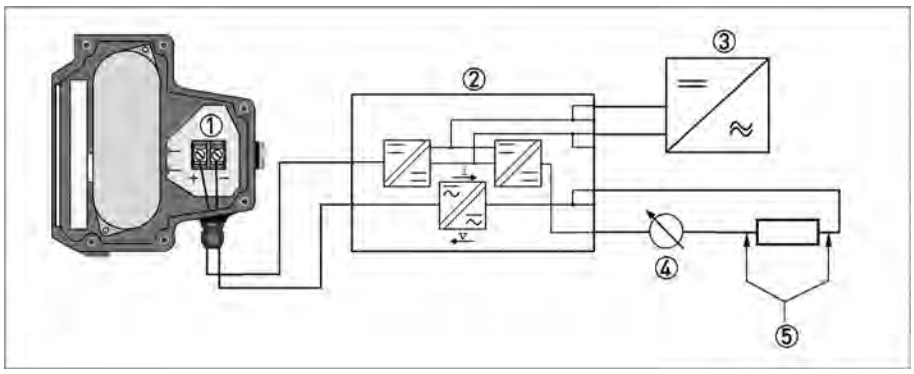

Figure 4-5: Electrical connection with galvanic isolation

① Terminal connection
② Converter supply isolator with galvanic isolation
③ Auxiliary power (see supply isolator information)
④ Measurement signal 4...20mA
⑤ External load, HART® communication

4.3.1 Power supply

The supply voltage has to be between 14.8VDC and 30VDC. This is based on the total resistance of the measuring loop. To determine this, add up the resistances of each component in the measuring loop (not including the meter).

The required supply voltage can be calculated using the formula below:

$U_{ext.} = R_L^* 22mA + 14.8V$

where
$U_{ext.}$ = the minimum supply voltage and
R_L = the total measuring loop resistance.

The power supply has to be able to supply a minimum of 22mA.

4.3.2 Load for HART® communication

For HART® communication a load of at least 230 ohm is required.

The maximum load impedance is calculated as follows:

$$R_L = \frac{U_{ext.} - 14,8V}{22\,mA}$$

Use a twisted two-core cable to prevent electrical interference from impeding the DC output signal.
In some cases a shielded cable may be necessary. The cable shield may only be earthed (grounded) at one place (on the power supply unit).

4.3.3 Parametrization

The M8E electronic display can be parametrized via HART® communications. DD (Device Descriptions) for AMS 6.x and PDM 5.2 and a DTM (Device Type Manager) are available for parametrization (download center).
The current flowrate can be transmitted using the integral HART® communications. A flow counter can be parametrized. Two limit values can be monitored. The limit values are assigned either to flow values or to the counter overflow. The limit values are not depicted on the display.

Please provide us with the missing information so that we can be of help to you as quickly as possible.

Then please fax this page to the appropriate sales associate. We will then contact you as soon as possible.
